

REPAIR WITH CEE KAY

GET UP AND RUNNING WITH CEE KAY

Welding equipment often needs to perform in challenging work place conditions. Even with basic maintenance and care, machines might still go offline due to a wide range of complications.

- Dirty filters can affect fuel efficiency and performance.
- Worn out drive rolls can impact wire feeding.
- Malfunctioning welding guns can cause blow backs and excessive spatter.
- Engine drives on the job site or truck get pummeled by rain, cold, heat, wind, sleet and more.

In many cases, dust, dirt, and grime are the main culprits of costly breakdowns. Hiring an expert to troubleshoot and diagnose your welding equipment may be the difference between fixing a simple problem and replacing an entire unit.

ADVANTAGES

- Certified Warranty Center for: Miller, Lincoln, Hypertherm, and more!
- Factory Trained Technicians
